

Strategic Intervention Selection, Architecture & Trade-off Reasoning

1. The Executive Decision Summary

Dimension	Strategic Decision Detail
Selected Intervention	Autonomous WhatsApp 'No-Show Concierge' & Instant Rescheduling Agent
Target Funnel Stage	Leak 2: Demo Scheduled → Demo Joined (36.2% no-show rate Rs. 61.63L/mo leak)
Financial Return	Recovering 20% of no-shows = +Rs. 12,32,557 / month (+Rs. 1.48 Crore annualized revenue)
Deployment Timeline	9 Days (Go-live well within the mandatory 2-week constraint)
Engineering Footprint	Zero engineering sprint (Wati WhatsApp API + Make.com / Zapier + OpenAI / Anthropic API)
Operating Cost	< Rs. 25,000 / month (Software subscriptions + WhatsApp message utility credits)
Implied Monthly ROI	> 4,800%

2. Why Leak 2 is the Highest-Leverage Strategic Target

In sales strategy, not all funnel leaks should be prioritized equally. Determining the optimal lever requires analyzing both **monetary magnitude** and **parental intent state**:

- 1. Largest Gross Dollar Pool (Rs. 61.63L/mo):** Leak 2 represents the highest single revenue loss in the entire pipeline, eclipsing Leak 1 (Rs. 59.56L/mo) and Leak 3 (Rs. 16.66L/mo).
- 2. High-Intent Cohort:** Unlike raw website leads, a parent who scheduled a demo has acknowledged the value proposition, chosen a curriculum track, and committed a calendar slot.
- 3. Friction, Not Active Rejection:** More than 70% of edtech no-shows are driven by calendar conflicts, child extracurricular clashes, or missing links — not loss of interest. An instant re-booking workflow converts them back.
- 4. Latency Reversibility:** Data proves that demos rescheduled <24h attend at 74.1%. Engaging a parent within 15 minutes of a missed demo keeps intent warm.

3. The Selected Lever: Autonomous WhatsApp 'No-Show Concierge'

The agent is an autonomous, conversational WhatsApp bot triggered immediately upon a rep marking a demo as 'No-Show' in the CRM:

Step 1: Real-time Trigger (T+15 min)	Rep logs 'No-Show' in CRM / Google Sheet. Webhook instantly triggers Make.com workflow.
Step 2: AI Concierge Outreach	Wati API sends personalized WhatsApp message in parent's local timezone: <i>'Hi Sarah! We missed Alex at today's BrightChamps Coding Demo! We know family life gets busy. Would you like to re-book for tomorrow? [Tomorrow 5PM] [Tomorrow 7PM] [Custom Time]'</i>
Step 3: One-Tap Rescheduling	Parent taps interactive button or chats with LLM agent. Cal.com syncs new slot to rep calendar.
Step 4: Automated Reminders	Automated WhatsApp nudge at T-2h and T-15m with single-click Zoom join link.

4. Alternatives Considered & Explicitly Rejected

To ensure rigorous executive decision-making, four alternative interventions were evaluated and rejected for violating either the 2-week speed constraint or empirical ROI realities:

Alternative Proposal	Expected Upside	Why It Was REJECTED	Verdict
Option A: Full CRM & Lead Routing Overhaul (Shift & Timezone matching)	High (~Rs. 15L–20L/mo by fixing 35% IST rep penalty on US leads)	Heavy engineering sprint required. Modifying routing logic, dialer integrations, and re-negotiating night shift employment contracts takes 6–8 weeks. Violates 2-week constraint.	[REJECTED] Too slow & heavy
Option B: Increased Rep Outbound Call Quota (Push from 4 to 8+ calls)	Low to Negative	Refuted by empirical dataset. Conversion collapses to 3.57% at 7 calls and 0.00% at 8–9 calls. Aggressive dialing annoys parents and burns out reps.	[REJECTED] Empirically invalid
Option C: Interactive Mid-Demo Gamification (Address Leak 3 dropouts)	Low (~Rs. 5L–7L/mo)	Small total leak pool (Rs. 16.66L/mo). Curriculum redesign and teacher training take months. Low upside relative to the Rs. 61.6L no-show pool.	[REJECTED] Low ROI pool
Option D: Retargeting Paid Ads on Meta/Google	Medium (~Rs. 10L/mo)	Increases customer acquisition cost. BrightChamps already spends Rs. 900/lead. Re-bidding on paid ads masks operational friction instead of fixing it.	[REJECTED] Capital inefficient

5. 14-Day Rapid Deployment Roadmap (Zero Engineering Sprint)

Because this intervention relies on existing SaaS orchestrators (Make.com + Wati API + OpenAI), deployment is handled entirely within the Founder's Office in **9 business days**:

Phase	Days	Key Milestones & Deliverables
Setup & Hook	Days 1 – 2	Connect Wati WhatsApp API to CRM via webhook. Configure status trigger upon 'No-Show'.
Content & Prompt	Days 3 – 4	Draft 3 conversational WhatsApp templates (A/B testing Empathetic vs Urgent tone).
Calendar Sync	Day 5	Integrate Cal.com dynamic booking links with automatic timezone localization.
Pilot Test	Days 6 – 7	Run pilot on historical no-shows across 2 top reps (AD-01 & AD-04). Test prompt conversion.
Optimization	Day 8	Tune trigger delay (15-min post demo vs 1-hour) based on initial parent open rates.
Full Rollout	Day 9	Go-live across all 12 reps and international regions.
Monitoring	Days 10 – 14	Track daily attendance recovery and measure baseline lift against 36.2% benchmark.

6. Financial Projections & Net ROI Calculation

- **Monthly No-Show Volume:** 584.5 leads / month.
- **Target Reschedule & Attendance Rate:** 20.0% = **116.9 recovered demo attendees.**
- **Benchmark Conversion of Joined Demos:** 17.57%.
- **Net New Monthly Conversions:** 116.9 × 17.57% = **20.54 students / month.**
- **Gross Revenue Added:** 20.54 × Rs. 60,000 = **Rs. 12,32,557 / month (+Rs. 1.48 Crore / year).**
- **Monthly Operating Tooling Cost:** Rs. 20,000 / month (Wati Pro tier + WhatsApp message fees).
- **Net Monthly Profit Lift:** Rs. 12,12,557 / month (>4,800% ROI).
